

CALCULATION ON MATERIAL BALANCE OF SSP MANUFACTURE

Muhammad Ishaque, Ishtiaq Ahmed and Nazir Ahmed Naseem

Fertilizer Technology Centre, P.O. Box 13, Faisalabad, Pakistan

(Received February 24, 1980; revised January 1981)

Material balance has been calculated for SSP manufacture from Jordan phosphate rock based on the mineralogical composition of Jordan rock specific sample. It has been found that by using acid rock ratio of 37.66 to 62.34 Kgs, 105.31 Kgs cured product (SSP) with 6% moisture is obtained.

INTRODUCTION

Single superphosphate (SSP) is being manufactured at NFC Lyallpur Chemicals & Fertilizers Limited, Faisalabad. Jaranwala by using Jordan phosphate rock. Theoretical calculations on The material balance of SSP were undertaken with a view to know the accurate quantities of the SSP being produced and also for a better understanding of the process by knowing the nature of all the chemical reactions occurring during the SSP manufacture.

Jordan phosphate rock of 90% -100 mesh finess is treated with 70% sulphuric acid in a U shaped trough provided with paddle type mixer. The slurry formed in the mixer is then fed to the Moritz Den revolving at the rate of one revolution in 2 hr. Preserving the heat of reaction helps complete the reaction and also helps collect and eliminate the gases evolved during the reaction. The slurry hardens during the slow rotation of Den and is discharged by the shaving action of the rotating cutter on the metallic conveyor. The ex-Den product becomes porous and semi-dry which can be cut, easily handled and stored in the shed for curing.

To start the theoretical material balance calculations it was essential to know the exact mineralogical composition of the Jordan rock i.e. the nature of various components which react with sulphuric acid.

Mineralogical composition of the Jordan rock sample MR-558 is known (taken from TVA un-published data). It is similar in composition to Jordan rock being used in the factory at present. This sample has therefore been selected for the material balance calculations.

Chemical Composition of Jordan Rock (Sample MR-558). CaO 49.20%; P₂O₅ 31.50%; CO₂ 5.00% F 3.80%; MgO 0.25%; Na₂O 0.70%; SiO₂ 6.00%; Al₂O₃ 0.35%; Fe₂O₃ 0.20%; K₂O 0.03%; Cl 0.16%; SO₃ 1.05%; Non-sulphate S 0.07%; N.D. matter 2.00%.

The phosphate rock (apatite) is always found substituted to various degrees and differ markedly in the manner in which chemical constituents are combined. Keeping in view the mineralogical composition of Jordan rock and numerous unpredictable complications during process such as incomplete reaction etc., following assumptions have been made for material balance purposes:

1. (a) All P₂O₅ is present as Ca₃(PO₄)₂. (b) All F is present as CaF₂. (c) All CO₂ is present as CaCO₃. (d) All SO₃ is present as CaSO₄ 2H₂O. (e) Any CaO not accounted for by the previous assumption is present as such, presumably in the apatite structure.
2. 25% of the CaF₂ present in the rock reacts with sulphuric acid and SiO₂ to form SiF₄ which is collected in the Scrubber as H₂SiF₂ and precipitates SiO₂ [1].
3. Under ordinary factory conditions where sulphuric acid (65 to 70%) and temperature of reaction is not dissipated by artificial cooling, anhydrite (CaSO₄) is the normal form of calcium sulphate in the final product [2].

Average analysis of the product, SSP is as under: Total P₂O₅ 20.20% (Equivalent to 64.12 grams of rock); Water soluble P₂O₅ 18.10%; Citrate soluble P₂O₅ 1.70%; Citrate insoluble P₂O₅ 0.4%; Free phosphoric acid 4.0%.

After applying the simplifying assumptions the composition of the rockphosphate therefore becomes as under: Ca₃(PO₄)₂ 68.83%; CaF₂ 7.80%; CaCO₃ 11.36%; CaSO₄ 2H₂O 2.26%; S 0.07%; NaCl 0.26%; Na₂O 0.60%; MgO 0.25%; Al₂O₃ 0.35%; Fe₂O₃ 0.20%; K₂O 0.03%; SiO₂ 6.00%; N.D. matter. 2.00%, and their reactions taking place are:

Ca₃(PO₄)₂ required for:

15.21%: W.S. P₂O₅ in the product. 33.21%.

According to calculations sulphuric acid and phosphate rock ratio =
 Acid : 37.60
 Rock : 62.34

The rated capacity of NFC Lyallpur Chemicals & Fertilizers Limited, Faisalabad SSP Plant is 60 tons / 24 hr, i.e. 2500 kg/hr. Material balance of the SSP produced has been worked out on the basis of the above theoretical calculated ratios and one hour's production of SSP (2500 kg) as follows:

| | |
|---|-------------|
| Rockphosphate required per hour (for 2500 kgs SSP). | 1613.49 kgs |
| Sulphuric acid 100% required | 974.58 kgs. |
| Water required for dilution of acid to 70% | 417.68 kgs |

MATERIAL BALANCE
